**"Panasonic Industry –
Everything from a single source"**

With our wide portfolio of automation products, we are the partner you are looking for to create solutions for completely networked manufacturing systems.

Panasonic Industry automation products

The digital revolution offers the manufacturing industry a wide range of opportunities to further expand production automation. Networked manufacturing systems can not only increase the production volume, but also the flexibility of the production itself. This means that manufacturers can react quickly to new requirements and trends, which increases overall production efficiency.

As an industrial partner, we must therefore meet above all two needs: on the one hand standard products and on the other hand complex, tailor-made solutions supplemented by added value services.

Panasonic Industry offers not only a wide portfolio of industry products covering the entire range of automation tasks, but also tailor-made consulting and support services. Our core business consists of machine and equipment building, the medical and pharmaceutical industries, building automation, water and waste water treatment, environmental technology and energy management.

Laboratory automation / measurement engineering

For laboratory automation, process reliability is the overruling principle. Thanks to their compact and miniaturized design, a large number of our products is installed in analytical testing systems. Small optical sensors in particular help to monitor the production process and the transport of samples. But also applications such as quality assurance (such as checking the caps for in-vitro diagnostics) show the versatility of our products. In addition to these standard sensors, Panasonic Industry also offers application-specific products such as bubble sensors that can reliably detect air bubbles in tubing.

Ionizers

In order to safely handle the increasingly sensitive electronic components in the production process and, for example, to avoid that samples are contaminated by adhering dust, it is becoming increasingly important to prevent static charges. Panasonic Industry offers different types of ionizers to remove electrostatic charge. Among the models with and without built-in fans, versions with different working widths, and a possible reduction of the residual voltage down to $\pm 10V$, there is a suitable solution for almost all tasks.

Safety solutions

Mechanical and hydraulic and forming presses, punching and riveting machines, forming systems, grommet presses and other automechanical assembly systems have exposed movable parts and therefore constitute a hazard zone for employees and personnel. Panasonic Industry clearly addresses employee well-being with its range of safety light curtains, muting sensors, safety switches and safety control units.

Internet of Things

The Internet of Things (IoT) also requires remote access devices, similar to M2M (machine to machine) communication. However, the IoT is also about collecting and processing data locally from sensors and actuators and sending them later via a gateway to the headquarter or into the cloud.

Here again, Panasonic Industry has been providing a versatile and flexible product that provides various solutions for this type of application in the form of the FP-I4C. Panasonic Industry offers a wealth of new equipment and technologies (IO-Link, PROFINET, EtherCAT, EtherNet/IP interfaces in our motors, sensors and programmable controllers) which are capable of implementing state-of-the-art solutions in the field of communication, such as the new Corvina.Cloud with fast remote diagnostics, maintenance and more.

Communications technology

M2M solutions streamline work processes while boosting productivity. Automatic orders can communicate independently to a central computer that they need to be refitted and which specific items are needed. The streamlining achieved with M2M solutions and the resulting cost savings can be a tremendous competitive advantage for the retail business. Effective maintenance thanks to remote diagnostics or the implementation of a resource management system can be reliably implemented by Panasonic Industry with a combination of smart sensors, touch panels, plus control and network technology.

Servo drivers and motors

With their broad spectrum, servo drives by Panasonic Industry are perfectly suitable for highly dynamic, small, and complex applications as well as mobile applications with DC motors.

Servo drives are a fundamental element in modern automation concepts. Using products by Panasonic Industry can improve the productivity and energy efficiency of industrial systems and equipment. After all, productivity and energy efficiency play a key role in the modern factory. New and higher performing industrial solutions are conquering the field of factory automation to increase efficiency in production. Automation mostly affects the transport and the processing of parts for an end product. This requires servo drives to control the motors that process parts or move them from one place to another. Depending on the type of production, different machines and different servo drives are needed. Here Panasonic Industry offers a wide range of servo drives and motors for all types of applications.

Communication between humans and machinery

The developments in the current industrial revolution demand the communication between humans and machinery in all areas. The touch panel of the machine, which serves as a communication port, is of major importance for successful networking. A logical display of processes and data on the screen is of utmost importance for the intuitive and correct operation of devices and machines by humans.

What would be more intuitive than a multi-touch operation that behaves similar to a smartphone? Panasonic Industry has expanded its touch terminal portfolio accordingly. Panasonic Industry touch terminals are combining the benefits from both worlds: on one hand, high-end devices for complex applications in the IoT area with corresponding functions and protocols and, on the other hand, a large bandwidth of functions without sacrificing robustness.

How does Corvina Cloud work?

Roles & applications

It is possible to define different roles with different user rights. Roles can be given access rights depending on the data needed and the application.

Secure connectivity

In its core, Corvina Cloud is a high-performance server with the latest open technologies to manage data and control flows, thus acting as a Platform as a Service (PaaS).

Gateways & endpoints

Our touch panels serve as gateways to the local network (HMe series, HMx700 series, HMs700 series, FP-I4C). They connect to a central server. All Panasonic PLCs, IP cameras, and other devices capable of connecting to the Internet can act as endpoints.

Traceability

To be networked throughout – this is one of the core demands of companies wishing to go beyond the paradigm of Industry 4.0. An important part of this is traceability – i.e. the complete traceability of components and products. Today, production is done mostly by lot sizes which have to be marked in a unique way to ensure high product safety, process reliability, and quality control. Due to environmental influences during production and use, markings on all types of products not only need to guarantee good readability to ensure traceability, but must also be resistant against scratches, temperature, light, and lubricants so that they are durable throughout the product's lifetime.

For marking their applications with a laser, the industry needs systems that are able to mark materials such as metals or plastics durably, quickly and accurately. Fiber lasers from Panasonic are a particularly good choice for this task.

LP-ZV series

3D short-pulse fiber laser marker boasting high marking definition on metal and plastic. Simple marking setting with a built-in camera for sharp and clear color image for accurate positioning.

- Small thermal effect on the workpiece thanks to the short pulses
- The wide marking field of 330mm × 330mm enables large size marking in a single marking operation.
- The 3D control allows for the marking of oblique, convex and concave surfaces in an area of 50mm (±25mm).
- Removable head with IP64 rating enhanced flexibility of equipment design and integration
- PROFINET / EtherNET/IP network units are provided to support the PLC connection
- Output class: 20W, 50W
- Especially well-suited for: high contrast marking on metal and plastics

LP-RH series

These CO2 laser marking systems are especially designed for industries with particularly high demands on speed and functionality. Thanks to their small laser beam diameter, certain models are especially well suited to apply very small markings on small components.

- New NAVI smart software makes it easy for operators to set up and monitor marking processes.
- Easy fine adjustment, the work distance can be adjusted within +/- 3mm without moving the laser head or the tool.
- Simplified installation thanks to head rotating mechanism on standard model or small installation footprint (Din B5) with the tower model.
- PROFINET / EtherNET/IP network units are provided to support the PLC connection
- Output class: 10W, 20W, 30W
- Especially well-suited for: 2D plastic and other organic materials (glass, wood, ceramics, etc.) applications
